The wild and desolate expanses of  
Antarctica have been the setting for many  
famous exploits and misadventures: a

place where every decision has life-or-death consequences. Legendary explorers such as Shackleton, Mawson and Scott continue to inspire to this day, and their faithful ships, the Endurance, Aurora and Tera Nova are vivid characters in their fateful voyages of discovery. The first and only Australian-built Antarctic flagship,

Aurora Australis, and her crews have likewise secured a place in Antarctic history. This is the 30-year story of Aurora Australis and of her diverse charges - crew, technicians, scientists, explorers, writers and artists. It's the tale of a problem-plagued construction, two devastating fires, a crippling besetment in ice and a

blizzard-induced grounding in Antarctica. It tells of brave rescue missions of other ships and their grateful crews, and of the heroic administering of medical help while battling life-threatening temperatures and hurricane-force winds. This is a tale of engineering brilliance, team tenacity and human resilience. It brings polar research

to life and unveils stunning scientific discoveries. It transforms the Aurora Australis into a compelling character in Australia's chapter of Antarctic history and makes heroes of the men and women who have guided her through the most inhospitable seascapes on earth.

The transcription factor (TF) mediated regulation of gene expression is a process fundamental to all biological and physiological processes. Genetic changes and epigenetic modifications of TFs affect target gene expression during the

formation of malignant cells. Extensive work has been done on the critical TFs in various disease models. Despite the success of numerous TF-targeted therapies, there remain significant hurdles understanding the mechanisms, transcriptional targets and networks of physiologic pathways that govern TF action. This effort is now

beginning to produce exciting new avenues of research. A clinically relevant topic for genetic change of TF is the mutant isoforms of p53, the most famous tumor suppressor. The p53 mutations either results in loss of function, or acting as dominant negative for wild-type protein, or ' gain of function '

specifically promoting cancer survival. The gain of function is achieved by shifting p53 binding partner proteins, or changed genomic binding landscape leading to a cancer-promoting transcriptome. Another example of genetic change of TF causing malignancy is the AML-ETO fusion protein in the human t(8;21)-leukemia.

## Access Free 2002 Olds Le Aurora Repair Manual

The fusion protein is an active TF, and more interestingly, new studies link the disease causing role of AML-ETO to the unique transcriptome in the hematopoietic stem cells. Nuclear receptors (NR) are a group of ligand-dependent TFs governing the expression of genes involved in a broad range of reproductive, developmental and

metabolic programs. Genetic changes and epigenetic modifications of NRs lead to cancers and metabolic diseases. Androgen receptor (AR), estrogen receptor (ER) and progesterone receptor (PR) are well studied NRs in prostate, breast and endometrial cancers. The development in sequencing technology and computational

genomics enable us to investigate the transcription programs of these master TFs in an unprecedented level. This Research Topic aims to present the most up-to-date progress in the field of transcription regulation in cancers and metabolic diseases.

This book grew out of the recent research conducted at the Boeing Company and the Defence Science and Technology Organisation (DSTO, Australia) over the past ten years. Consequently it is predominately a compilation of the work by the authors
