The Deep Mixing Method (DMM) was developed and put into practice in Japan in 1975 to cope with the headaches of stability and/or excessive settlement in soft soil areas. This method involves using cement and/or lime as a soil stabilizer, added in-situ to deep soils, and has now been adopted not only in Japan but in the USA and other parts of the world as well.

Among these stabilizing techniques, the deep mixing method is regarded as the most popular. The deep mixing method is a soil modification method where the soil is mixed in situ with stabilizing agents, commonly soil-cement columns. It increases the strength of the soil, providing bearing resistance and improved settlement performance.

DEEP CEMENT-SOIL MIXING (DCM) METHOD In construction of various structures on compressible, saturated soils like soft clay, low bearing capacity and excessive settlement are a common problem to deal with. The ground improvement technique using deep cement-soil mixing (DCM) is one of the most suitable methods to overcome this problem.

THE DEEP SOIL MIXING TECHNIQUE Deep soil mixing is an in situ ground improvement technique that enhances the characteristics of weak soils by mechanically mixing them with a cementitious binder. The action of mixing materials such as cement, fly ash, lime or bentonite with soil causes the properties of the soil to become more like soft rock.

About Deep Soil Mixing - Soil Stabilisation, ground ...

The principle of the trench mixing method is to produce a soil mix barrier, generally up to a depth of 10 m, in a single continuous pass, which is an advantage particularly in the case of water retaining function (no joints). Figure 11.8 shows the Trenchmix system.

Deep soil mixing was the chosen construction method, ahead of jet grouting, on cost and efficiency grounds. A fluid water cement grout mix is injected into the ground using an auger drill. The construction of containment walls using this technique, and their applications to in situ treatment of contaminated soils are discussed.

In Keller's deep soil mixing method a special mixing tool is inserted into the soil on site. This mixing tool comprises a drilling rod, transverse beams and a drill end with a head. The drilling causes no vibrations, and is assisted by cement slurry outflow from nozzles purposely located at the end of the soil auger.
