Groundwater is the largest reservoir of fresh water. The water table is the top of an aquifer below which is water and above is rock or soil mixed with air. Aquifers are underground areas of sediment or rock that hold groundwater. An aquifer needs good porosity and permeability. Where groundwater intersects the ground surface, a spring can form.

Groundwater is one of our most valuable resources—even though you probably never see it or even realize it is there. There is water somewhere beneath your feet no matter where on Earth you live. Groundwater starts as precipitation, just as surface water does, and once water penetrates the ground, it continues moving, sometimes quickly and sometimes very slowly.

**Groundwater True/False Quiz - USGS.gov + Science for a -**

Zone of Aeration: is located just below the surface where the spaces between the soil particles are filled with air. Zone of Saturation: is where the spaces between the soil particles are filled with water. The Water Table: is the interface between the 2 zones.

**Groundwater - Regents Earth Science**

The water travels down through the permeable rock until it reaches a layer that does not have pores; this rock is impermeable ( Figure below ). This impermeable rock layer forms the base of the aquifer. The upper surface where the groundwater reaches is the water table. Groundwater is found beneath the solid surface.
