Videm showed that different electrochemical methods gave a large divergence in linear polarization (R p) resistance when measuring corrosion rate for steel exposed to alkaline solutions by cyclic voltammetry, potentiostatic exposure, potentiostatic pulses, galvanostatic pulses and EIS. The dominating reason was that redox reactions of the corrosion product could consume a part of current, which decreased the polarization resistance and increased the corrosion rate.

Electrochemical Methods at Open Circuit. Electrochemical techniques used to study crevice corrosion include those where no external signal is applied (open circuit) and ones that involve perturbing the system with an applied signal. The corrosion potential (E cor) of a crevice exposed to an electrolyte is measured against a reference electrode at open circuit. This technique is the most basic electrochemical measurement.

Electrochemical Techniques and Corrosion Corrosion is the chemical or electrochemical reaction between a material, usually a metal, and its environment that produces a deterioration of the material and its properties. (ASTM G 15: Standard Terminology Related to Corrosion.) Corrosion is caused by a redox reaction.
