Organic Name Reaction Gabriel Phthalimide

The Gabriel synthesis is an organic reaction used to convert an alkyl halide to a primary amine using phthalimide with base and followed by hydrazine. The reaction begins with the deprotonation of the phthalimide which then attacks the alkyl halide in an S<sub>N</sub>2 fashion to give an N-alkylphthalimide intermediate. The intermediate is then cleaved by hydrazine in a series of steps that end with the liberation of the final primary amine product and phthalhydrazide by-product.

Gabriel synthesis ~ Name-Reaction.com

The Gabriel synthesis is a chemical reaction that transforms primary alkyl halides into primary amines. Traditionally, the reaction uses potassium phthalimide. The name of the reaction comes from the German chemist Siegmund Gabriel.

- NH<sub>2</sub>-synthon which allows the preparation of primary amines by reaction with alkyl halides. After alkylation, the phthalimide is not nucleophile and does not react anymore. Product is cleaved by reaction with base or hydrazine, which leads to a stable cyclic product.

primary amines. Traditionally, the reaction uses potassium phthalimide. The reaction is named after the German chemist Siegmund Gabriel. The Gabriel reaction has been generalized to include the alkylation of sulfonamides and imides, followed by deprotection, to obtain amines. The alkylation of ammonia is often an unselective and inefficient route to amines. In the Gabriel method, phthalimide anion is employed

Phthalimide - Wikipedia

No, We know that Gabriel phthalimide reaction requires the treatment of potassium phthalimide with  $C_6H_5Cl$  or  $C_6H_5Br$ . Since aryl halides do not undergo nucleophilic substitution under ordinary laboratory conditions, therefore  $C_6H_5Cl$  or  $C_6H_5Br$  does

not react with potassium phthalimide to give N - phenylphthalimide and hence aniline cannot be prepared by this method.
