Peripheral nerve issues are potential sequelae of orthopedic surgery, even after cases in which technically excellent surgery was performed. These injuries can impede the expected recovery of function after the primary surgery. Given the manifold challenges associated with recovery of peripheral nerve injuries, this book is designed as a multidisciplinary guide to the diagnosis, prognostication and treatment of peripheral nerve issues after common orthopedic surgeries. Beginning with an overview of nerve compression, injury and regeneration, as well as a presentation of the current diagnostic and imaging modalities for peripheral nerve injuries, this unique text is organized by anatomic region and by type of procedure performed. Topics covered include shoulder and elbow arthroplasty and arthroscopy, fractures of the hand and wrist, hip preservation surgery, total knee replacement, open surgery of the foot and ankle, lumbosacral myeloradiculopathy, and more. Each chapter is authored by both a subspecialty surgeon who routinely performs the surgeries described and a subspecialized hand/peripheral nerve surgeon with experience in evaluating and treating nerve issues after that particular

injury. Emphasis is placed on multidisciplinary team approaches, patient counseling, and technical aspects of surgical treatment. Peripheral Neurology was the first book to innovatively utilize case presentations as a vehicle to teach peripheral neurology. In fact, it was the first to categorize the field of peripheral neurology, as most other neurology texts concentrated on diseases of the central nervous system. This case approach has since been emulated in many other texts and on various web sites. Emphasizing the clinical condition rather than electrodiagnostic technique, each topic is thoroughly addressed, first in the Fundamental Concepts of Part I, and then in multiple Case Studies presented in Part II. The reader is able to simulate a true clinical environment where a diagnosis has to be arrived at with no organizational clues from the text. Formulating conclusions by analyzing the history, physical, and laboratory data, and linking from case to related case, this is the only text which allows this type of "interactive" reading. The book addresses many rare entities that the author is able to present based on his 30-years of experience.
